

High Blood Pressure (Hypertension)

Approximately 30% of people living in the UK currently suffer from high blood pressure. This increases to approximately two in three people aged 75 years old and over, as blood pressure rises with age.

What is High Blood Pressure?

High blood pressure happens when the pressure of the blood flowing to and from the heart is raised consistently over 140/90mmHg.

In the majority of cases there are no symptoms at all, so it is important to have your blood pressure checked every couple of years.

Symptoms of High Blood Pressure

Some of the symptoms of high blood pressure are:

- Headaches
- Dizziness
- Problems with vision

If high blood pressure is not treated and kept under control, it can cause [heart disease](#) or a [stroke](#).

How to help prevent high blood pressure

In about 90% of cases there is no specific cause for high blood pressure. However, you can help to prevent it or to reduce it in the following ways:

- Have your blood pressure checked every few years (or every year if you've had a high or borderline reading in the past).
- Eat a healthy diet by reducing your salt intake and eating and drinking low-fat dairy products. See our section on [Healthy eating and drinking](#) for more information on this.
- Exercise regularly. See our section on [Keeping physically active](#) for more information on this.
- Stop smoking. See our section on [Giving up smoking](#) for more information on this.

Your GP may also prescribe medication to help to lower your blood pressure.
